Tachyplesin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the adualphide bridge. The novel derivatives are used to deliver active agents to an organism. e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, antivirals and anti-inflammatories, etc. The derivatives are non-toxic and non-lytic but can cross mammalian cell membranes rapidly by a passive including crossing the blood-brain barrier.
                                                                                                                                                                                                                                                               ô

By using the peptide as a vector for delivery of the anticancer agent, mechanisms that cause cancer cells to become resistant to the agent, particularly produced by chemical synthesis, can be coupled easily to the agent, cross mammalian cell membranes rapidly by a passive mechanism (no receptors required), and are non-toxic and non-lytic. The compositions are used to treat cancer. The present sequence represents a peptide which may be linked to the anticancer agents of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Sequences AAV69610-Y69611 and AAV69617 represent tachyplesin analogues
used in an exemplification of the present invention, in which the
constine tachyplesin cysteine residues are replaced with Ala, Leu and
control tachyplesin cysteine residues are replaced with Ala, Leu and
control analogues of tachyplesin (AAV69608) is a naturally occurring
antimicrobial peptide which contains two disulphide bonds which help
control maintain its tertiary structure. The invention relates to novel
comparide analogues of tachyplesin (Y696912-AAV69614, AAV69616) in which
control methonine, phenylalanine or tyrosine, the same amino acid being
controlling fungal and viral acidyplesin analogues are functional as
intramolecular disulphide bonds, the analogues are functional as
controlling sand for controlling plant viruses. They can also be
controlling sand for controlling plant viruses. They can also be
controlling maize plants, preferably wheat, sorghum, sunflower,
controlling maize plants, preferably wheat, sorghum, sunflower,
coya or especially maize plants to provide resistance to pathogenic fungil
controlling the present sequence is not shown in the
controlling and viral activity in assistance to pathogenic fungil
controlling the present sequence is not shown in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium praninearum, Fusarium moniforme, Sclerothina sclerotiorum, Sclerothina trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

/note= "The molecule has the same amino acid at all four
of the above positions"
                                                                                                                                                                                                                                                                                                                   AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshee crab heamocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium moniforme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                             New peptide derivs. of tachyplesin - having antimicrobial activity, used against plant pathogenic fungi or human or animal infections

This sequence represents a generic tachyplesin (TP) analogue which has antimicrobial activity. Tachyplesin (AAY69608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which help to maintain list tertiary structure. The invention relates to novel to maintain list tertiary structure. The invention relates to novel peptide analogues of tachyplesin (Y696912-AAY69614, AAY69616) in which the cysteine residues at positions 3, 7, 12 and 16 of the mattive the cysteine replaced by the hydrophobic amino acids isoleucine, valine, methionine, phenylalanine or tyrosine, the same amino acid being present at all four positions. Despite being unable to form antimicrobial agents. The tachyplesin analogues are functional as intramalecular disulphide bonds, the analogues are functional as antimicrobial agents. The tachyplesin analogues are useful for controlling fungal and viral activity in agricultural and medalcal applications and for controlling plant viruses. They can also be expressed in transgenic plants, preferably wheat, sorghum, sunflower, sorgenic fungi
                                                                                                                                                                                                   New tachyplesin analogs useful for controlling fungal and bacterial activity in agricultural and medical applications and for controlling plant viruses have four cysteine substitutions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75605) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium monificame, Sclerctinia sclerotiorum, Sclerctinia trifolorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δ
                                                                                                                                                           sequences AAY69610-Y69611 and AAY69617 represent tachyplesin analogues used in an exemplification of the present invention, in which the native tachyplesin cysteine residues are replaced with Ala, Leu and Asp, respectively. Tachyplesin (AAY69608) is a naturally occurring antimicrobial peptide which contains two disulphide bonds which help to maintain its teritary structure. The invention relates to novel peptide analogues of tachyplesin (Y696912-AAY66914, AAY69616) in which the cysteine residues at positions 3, 7, 12 and 16 of the native tachyplesin are replaced by the hydrophobic amino acids isoleucine, valine, methionine, phenylalanine or tyrosine, the same amino acid being present at all four positions. Despite being unable to form intramolecular disulphide bonds, the analogues are functional as intramolecular disulphide bonds, the malogues are useful for antimicrobial agents. The tachyplesin analogues are useful for controlling fungal and viral activity in agricultural and medical applications and for controlling plant viruses. They can also be corressed in transgenic plants, preferably wheat, sorghum, sunflower, soya or especially maize plants to provide resistance to pathogenic funging and viruses. Note: The present sequence is not shown in the sequence given in column 23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR7805) a small peptide isolated from japanese horseshoe crab haemcoytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium monilforme, Sclerotinia sclerotiorum, sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and animals.
                                                                                                                                                                                                                                                                                                        New peptide derivs. of tachyplesin - having antimicrobial activity, used against plant pathogenic fungi or human or animal infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tachyplesin; inhibitor; antimicrobial; plant pathogen; fungi;

The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium graminearum, Fusarium monificame, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

The lipopolysaccharide-binding polypeptides may be prepd. by either solid-phase peptide synthesis followed by oxidn. to form the disulphide bridges or, subjecting horseshoe crab haemocytes to hypotonic extraction, extracting the residue with acid, and purifying the extract. The polypeptides have high affinity for lipopolysaccharide (LBS) endotoxins and are useful for removing such toxins from fluids, as antibacterial agents, eg active against Salmonella spp. and S. aureus, and for tracheborachial infections, urinary tract infections, bedsores, collisis, cirrhosis, hepatic insufficiency and post-operative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antivirus agents of polypeptide - useful as antivirus agents for vesicular stomatitis virus or human immuno-deficiency virus

                                                                                                                                                                                                                                                                                                                                                                         ó
                                                                                                          AAR75802-04 and AAR75806-22 are peptide derivatives of tachyplesin (AAR75805) a small peptide isolated from japanese horseshoe crab haemocytes which has antimicrobial properties. The peptide derivatives also have antimicrobial activity and can be used for killing and inhibiting fungi, in particular for fungi pathogenic to plants e.g. Fusarium moniforme, Sclerotinia sclerotiorum, Sclerotinia trifoliorum and Aspergillus flavus. The peptides can also be used for treating and preventing infection in humans and

Sequence 5, Application US/08168809
Patent No. 5580852
GENERAL IPPORMATION:
GENERAL IPPORMATION:
APPLICANT: Putnam, Rebecca J.
APPLICANT: Rao, Aragula G.
TITLE OF INVENTION: DERIVATIVES OF TACHYPLESIN HAVING
TITLE OF INVENTION: INHIBITORY ACTIVITY TOWARDS PLANT PATHOGENIC FUNGINUMBER OF SEQUENCES: 21
CORRESPONDENCE ADDRESS:
ADDRESSEE: Pioneer Hi-Bred International
STREET 700 Capital Square, 400 Locust Stree
CITY: Des Moines
                                                                                                                                                                                                                                                                                                                                                                                                                                                          COMPUTER READABLE FORM:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A; Accession: F33287
A; Status: nucleic acid sequence not shown; not compared with conceptual translation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A. Molecule type: DNA
A. Residues: 53-88, DNA
A. Residues: 53-88, DN, 90-109 < GYL>
A. Experimental source: allele designated DQB 1.3
A. Experimental source: allele designated DQB 1.3

PHOSPHORYLATES STAT6, IRS1, IRS2 AND PI3K.
-!-CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP + PROTEIN TYROSINE = ADP + PROSINE PHOSPHATE.
-!-SUBCELLULAR LOCATION: WHOLLY INTRACELLULAR, POSSIBLY MEMBRANE ASSOCIATED (BY SIMILARITY).
-!-TISSUE SPECIFICITY: TRANSCRIBED IN A VARIETY OF TISSUES INCLUDING SPLEEN, LUNG, KIDNEY AND INTESTINE.
-!-DOMAIN: POSSESSES TWO PHOSPHOTRANSFERASE DOMAINS. THE SECOND ONE PROBABLY CONTAINS THE CATALYTIC DOMAIN (BY SIMILARITY), WHILE THE PRESENCE OF SLIGHT DIFFERENCES SUGGEST A DIFFERENT ROLE FOR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ATP (BY SIMILARITY).

                                                                                                                                                                               DOMAIN: POSSESSES TWO PHOSPHOTRANSFERASE DOMAINS. THE SECOND ONE PROBABLY CONTAINS THE CATALYTIC DOMAIN (BY SIMILARITY), WHILE THE PRESENCE OF SLIGHT DIFFERENCES SUGGEST A DIFFERENT ROLE FOR
DIFFERENT MRNA SOURCES: BREAST (JAK3B), SPLEEN (JAK3S; SHOWN HERE), AND ACTIVATED MONOCYTES (JAK3M). JAK3B MAY BE DEFECTIVE AS IT LACK SOME PART OF THE KINASE DOMAIN.
TISSUE SPECIFICITY: IN NK CELLS AND AN NK-LIKE CELL LINE BUT NOT IN RESTING T CELLS OR IN OTHER TISSUES. THE S-FORM IS MORE COMMONLY SEEN IN HEMATOPOIETIC LINES, WHEREAS THE B- AND M-FORMS ARE DETECTED IN CELLS BOTH OF HEMATOPOIETIC AND EPITHELIAL
                                                                                                                                                                                                                                                                                                                                                            OF
                                                                                                                                                                                                                                                                   PTM: TRACSINE PHOSPHORYLATED IN RESPONSE TO IL-2 AND IL-4.
DISEASE: DEPECTS IN JAK3 ARE A CAUSE OF RECESSIVE T-CELL
DISEASE: DEPECTS IN JAK3 ARE COMBINED IMMUNODEFICIENCY (T-B+

DOMAIN: POSSESSES TWO PHOSPHOTRANSFERASE DOMAINS. THE SECOND ONE PROBABLY CONTAINS THE CATALYTIC DOMAIN (BY SIMILARITY), WHILE THE PRESENCE OF SLIGHT DIFFERENCES SUGGEST A DIFFERENT ROLE FOR
       ASSOCIATED (BY SIMILARITY).
ALTERNATIVE PRODUCTS: 3 ISOFORMS; 1 (SHOWN HERE), 2 AND 3; ARE PRODUCED BY ALTERNATIVE SPLICING.
FISSUE SPECIFICITY: HIGHEST LEVELS FOUND IN THE THYMUS WITH SOMEWHAT LOWER LEVELS IN BONE MARROW, SPLEEN, FETAL LIVER AND ADULT CD4-CD8-THYMOCYTES. VERY LOW LEVELS IN ADULT KIDNEY, LUNG,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Repeat: Alternative splicing.

AT "Tyosine phosphorylation of Crk-associated substrates by focal adhesion kinase. A putative mechanism for the integrin-mediated tyrosine phosphorylation of Crk-associated substrates.";

J Biol. Chem. 272:29081-22090(1997).

A Biol. Chem. 272:29081-22090(1997).

IMPLICATED IN INDUCTION OF CELL MIGRATION (BY SIMILARITY).

CHORD TYROSINE-KINASE-BASED SIGNALING RELATED TO CELL ADHESION.

IMPLICATED IN INDUCTION OF CELL MIGRATION (BY SIMILARITY).

ADAPTER PROTEIN CRKL AND LYN KINASE.

CHARDELULAR LOCATION: FOCAL ADHESIONS AND STRESS FIBERS.

UNPHOSPHORYLATED FORM LOCALIZES IN THE CYTOPLASM AND CAN MOVE TO THE MEMBRANE UPON TYROSINE PHOSPHORYLATION.

CHARD TRODUCTS: 2 ISOSORMS; A LONG ISOSOPOM (SHOWN HERE)

AND A SHORT ISOFORM; MAY BE PRODUCED BY ALTERNATIVE SPLICING.

LATESINE SPECIFICITY: WIDELY EXPRESSED. HIGHER EXPRESSION IN LUNG, INFERENT AND METERS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     entities requires a license@isb-sib.ch).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!- DOMAIN: CONTAINS A CENTRAL DOMAIN (SUBSTRATE DOMAIN) CONTAINING MULTPLE POTENTIAL SH2-BINDING SITES AND A C-TERMINAL DOMAIN CONTAINING A DIVERSERNT HELIX-LOOP-HELIX (HLH) MOTIF. THE SH2-BINDING SITES PUTATIVELY BIND CRK, NCK AND ABL SH2 DOMAINS. THE HLH MOTIF IS ABSOLUTELY REQUIRED FOR THE INDUCTION OF PSEUDOHYPHAL GROWTH IN YEAST AND MEDIATES HETERODIMERIZATION WITH CASL.
                                           "A novel signaling molecule, pl30, forms stable complexes in vivo with v-Crk and v-Src in a tyrosine phosphorylation-dependent manner."; EMBO J. 13:3748-3756(1994).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -1- SIMILARITY: CONTAINS 1 SH3 DOMAIN, NECESSARY FOR THE LOCALISATION OF THE PROTEIN TO FOCAL ADHESIONS AND INTERACTS WITH ONE PROLINE-RICH REGION OF FOCAL ADHESION KINASE 1.
-1- SIMILARITY: CONTAINS 1 SH3-BINDING DOMAIN. THE SH3 BINDING DOMAIN.
BINDS TO THE SRC SH3 DOMAIN.
-1- SIMILARITY: BELONGS TO THE CAS FAMILY.
